

Storms and their Consequences in the United States

Xi Fang

5/31/2020

Introduction

Storms and other severe weather events can cause both public health and economic problems for communities and municipalities. Many severe events can result in fatalities, injuries, and property damage, and preventing such outcomes to the extent possible is a key concern.

This project involves exploring the U.S. National Oceanic and Atmospheric Administration's (NOAA) storm database. This database tracks characteristics of major storms and weather events in the United States, including when and where they occur, as well as estimates of any fatalities, injuries, and property damage.

Research questions

1. Across the United States, which types of events (as indicated in the EVTYPE are most harmful with respect to population health?
2. Across the United States, which types of events have the greatest economic consequences?

Synopsis

In this data analysis, I sought to investigate weather events that cause the most damage to the U.S in terms of fatalities and injuries of population as well as the economic damages including properties damage and crop damages.

Data Processing

Answer the two research questions ### Events are most harmful to population health?

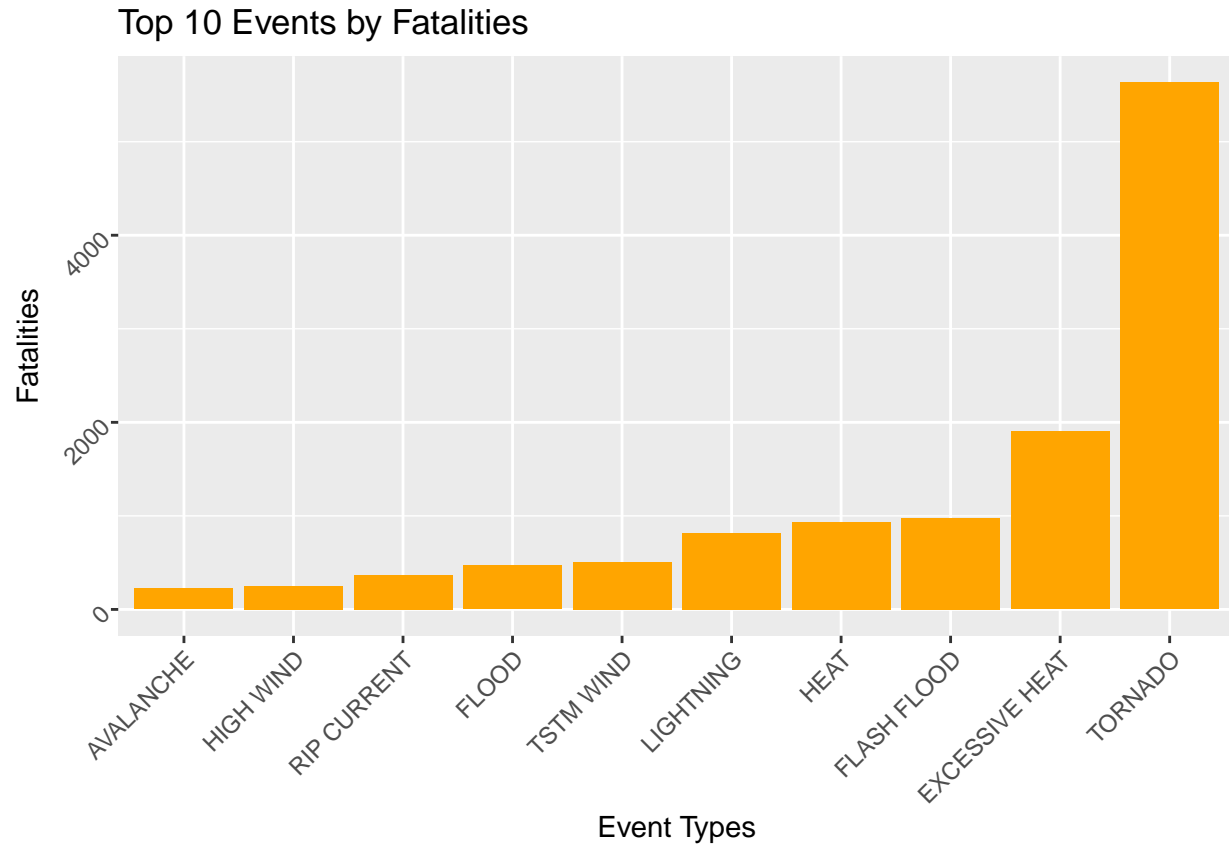

```
data <- read.csv("repdata_data_StormData.csv", header = TRUE)
# Fatalities
fatatality <- aggregate(FATALITIES ~ EVTYPE, data= data, FUN = sum)
dim(fatatality)
```

```
## [1] 985 2
```

```
## top 10 weather events with most fatality
topfata <- fatatality[order(-fatatality$FATALITIES),][1:10,]
library(ggplot2)
g1 <- ggplot(topfata, aes(x = reorder (EVTYPE, FATALITIES), y =FATALITIES)) +
  geom_bar(stat = "identity", fill = "orange") +
```

```
ggtitle("Top 10 Events by Fatalities") +
labs(x="Event Types", y="Fatalities") +
theme(axis.text = element_text(angle = 45,hjust = 1))
```

g1

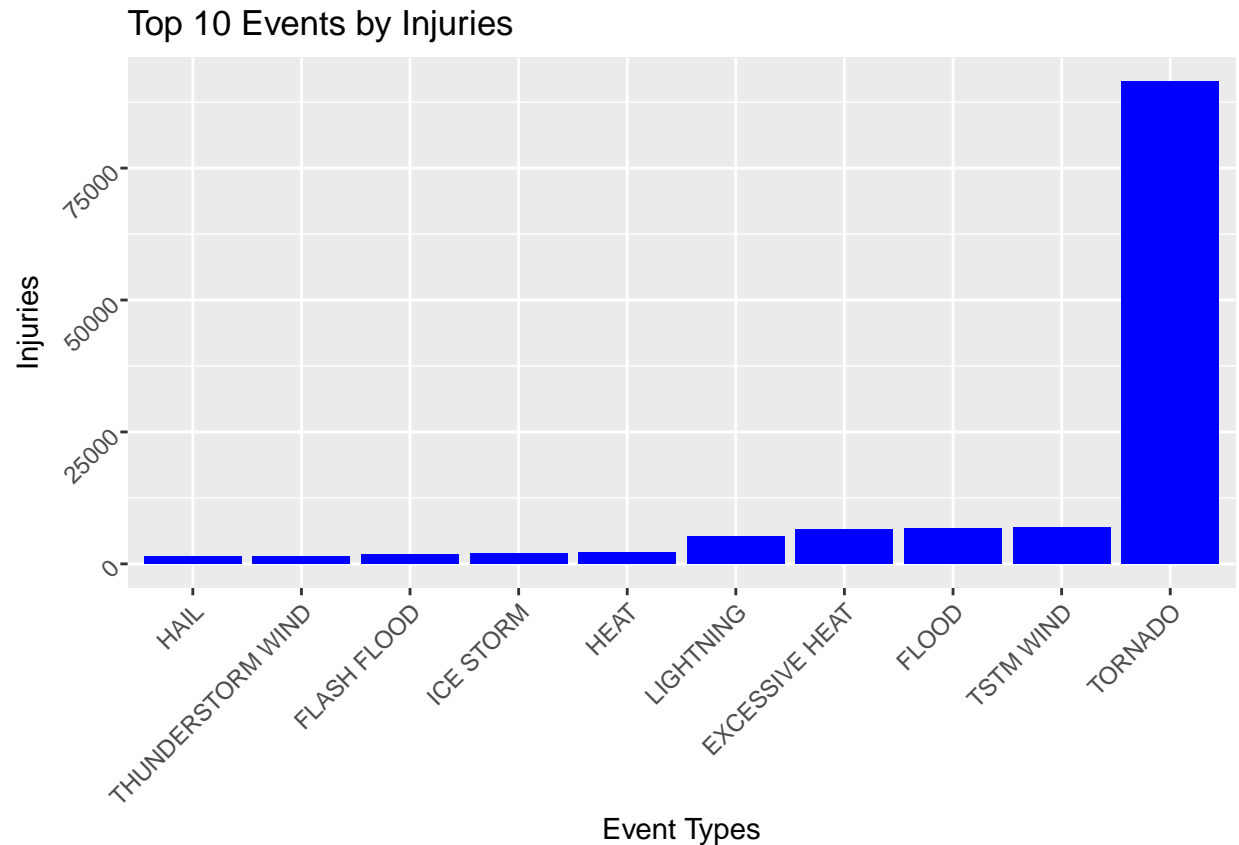

Based on this result, tornados are the most harmful events that cuase the highest fatality in the U.

Injuries

```
injuries <- aggregate(INJURIES ~ EVTYPE, data= data, FUN = sum)
dim(injuries)
```

```
## [1] 985 2
```

```
topinju <- injuries[order(-injuries$INJURIES),][1:10,]
g2 <- ggplot(topinju, aes(x = reorder (EVTYPE, INJURIES), y =INJURIES)) +
  geom_bar(stat = "identity", fill = "blue") +
  ggtitle("Top 10 Events by Injuries") +
  labs(x="Event Types", y="Injuries") +
  theme(axis.text = element_text(angle = 45,hjust = 1))
g2
```

Based on this result, tornados are the most harmful events that cuase the highest injuries in the U.

Events have the greatest economic consequences?

```
## processing
data$PROPDMGMult <- ifelse (data$PROPDMGEXP == "K", 1000, ifelse (data$PROPDMGEXP == "M", 1000000, ifel

data$PROPDMGAMT <- data$PROPDMG*data$PROPDMGMult

data$CROPDMGMult <- ifelse (data$CROPDMGEXP == "K", 1000, ifelse (data$CROPDMGEXP == "M", 1000000, ifel

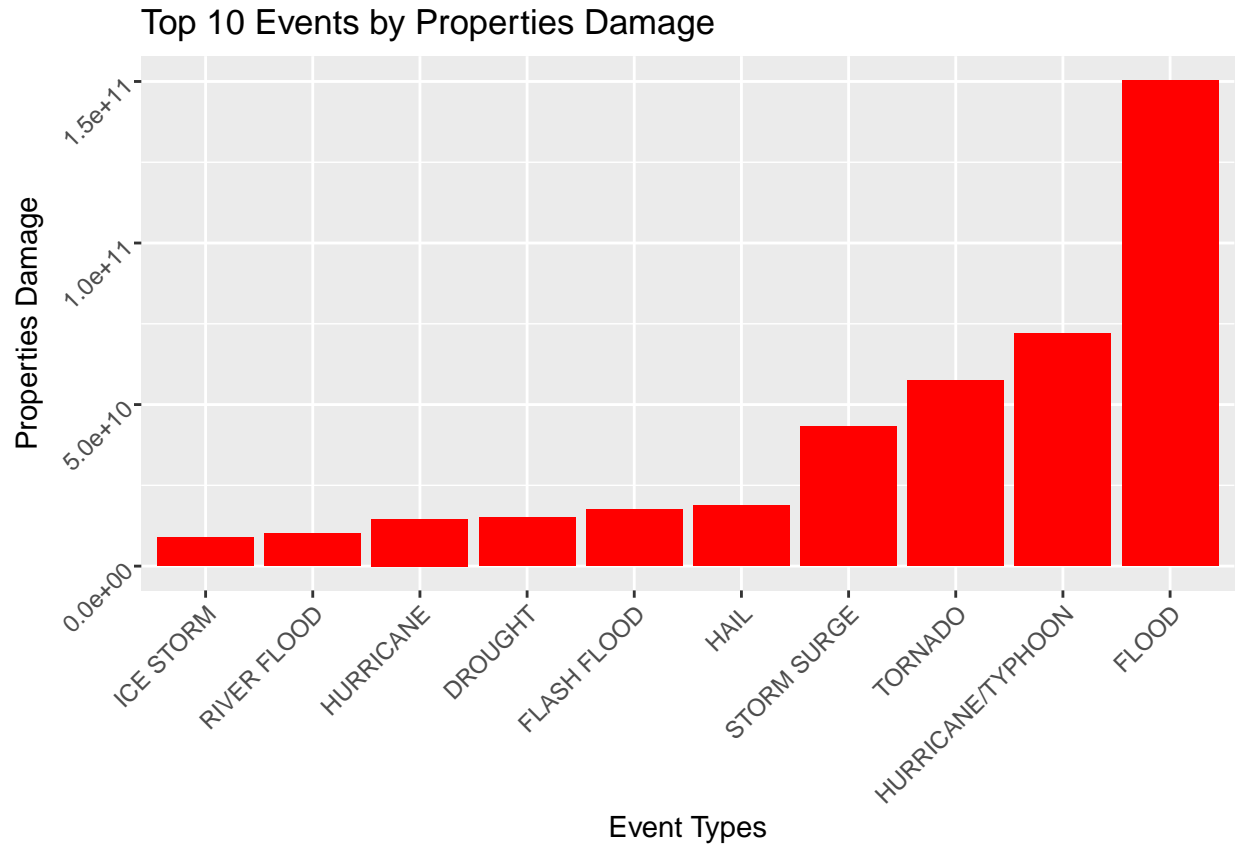

data$CROPDMGAMT <- data$CROPDMG*data$CROPDMGMult

data$TOTALDMGAMT <- data$PROPDMGAMT+data$CROPDMGAMT
# properties damage
tdamage <- aggregate(TOTALDMGAMT ~ EVTYPE, data= data, FUN = sum)
dim(tdamage)
```

```
## [1] 985 2
```

```
toppdam <- tdamage[order(-tdamage$TOTALDMGAMT),][1:10,]
g3 <- ggplot(toppdam, aes(x = reorder (EVTYPE, TOTALDMGAMT), y =TOTALDMGAMT)) +
  geom_bar(stat = "identity", fill = "red") +
```

```
ggtitle("Top 10 Events by Properties Damage") +
labs(x="Event Types", y="Properties Damage") +
theme(axis.text = element_text(angle = 45,hjust = 1))
g3
```

Based on this result, floods are the most harmful events that cause the highest economic damage in terms of properties.

Results and Conclusions

question 1

- As shown in the figure, Tornadoes causes the greatest number of Fatalities and Injuries.
- In particular, in terms of fatalities, after Tornadoes, EXCESSIVE HEAT, FLASH FLOOD and HEAT are the next ones.
- In particular, in terms of injuries, after tornadoes we have TSTM WIND, FLOOD and EXCESSIVE HEAT.

question 2

- Floods have the greatest economic consequences based on total dollars of property and crop damage, followed by Hurricanes.

Conclusions

In our analysis of weather events that cause the most adverse effect in the U.S, we found that tornados cause the most damage in the population including fatalities and injuries, while floods cause the most damage to the ecoomy in the U.S.
